

CONCUSSION

A concussion is a type of brain injury. It often happens because of a hit to the:

- head
- neck or face
- body

When you are hit on the head or body, your brain moves inside the skull. This movement can cause brain injury, such as a concussion.

A concussion can't be seen on routine image scans, such as an MRI, X-ray or CT scan. It is diagnosed by observing changes in the way a person thinks and feels.

Get help right away if you have these symptoms

- neck pain
- double vision
- loss of consciousness
- seizure or convulsion
- vomiting over and over again
- headache is severe or getting worse
- weak, tingling or burning feeling in arms or legs
